(57) Abstract :
The proposed research initiative addresses challenges faced by 201, particularly in challenging circumstances, by developing a cost-effective wearable device. The hybrid , sustainable sensor, comprising Polyvinylidene fluoride/Graphene/Polydimethylsiloxane/ZincOxide integrated into a 15 over fabric material that allows air to circulate, helping to regulate body temperature and reduce sweating, enables 203,204, reducing the need for frequent hospital visits. The device, attached to an 15 with the help of adjustable 1,2, utilizes 204 to connect to 203, linking to mobile application. The smart device system employs advanced deep learning models for real-time analysis of 201. The 202 technology ensures noise cancellation and filtering, enhancing monitoring accuracy and empowering pregnant women to manage their health effectively. The entire system works based on the co-power generation from 207 keeps the sensors powered without the need of an external power source.
